TITLE : GOLF TEE

ABSTRACT : PURPOSE: To decrease the resistance at the time of impact by arranging upward radially plural supporting arms having a spring action which are inclined to the outside of a pedestal member and energized elastically to the center side of the pedestal member, in this pedestal member to be set to the ground.

CONSTITUTION: In a pedestal member 1 to be set to the ground, plural supporting arms 2 having a spring action which are inclined to the outside of this pedestal member 1 and energized elastically to the center side of the pedestal member 1 are arranged radially toward the upper part. Also, as for the pedestal member 1, the case when it is constituted so as to be placed directly on the ground for tee-up, the case when it is constituted so as to be coupled with a supporting member 3 pierced into the ground and to be fixed to the ground, and also, the case when it is supported so as to undulate freely by a base member 11 placed on the ground and constituted erectly to its base member 11, etc., exist. In such a way, a support area of a golf ball at the time of tee-up becomes small, hit-out resistance at the time of impact is scarcely generated, and a sufficient flying distance can be secured.
